

SiBoNi: Product Prototype Flow

Broadly there are three types of users of SiBoNi. **The first set** of users are **executives** typically CEO, CSO, CMO, CFO, CISO, CIO, CTO, COO, CPO who are typically focussed on **decisions, KPIs, risk and signals**. They care about signals as it informs their decisions while strategy formulation is delegated to their leaders. They don't want to spend time on promoting or researching. Their time is focussed on decision making and managing by exceptions. **The second set** of users are **leaders or their analysts** who would like to dive deep, prompt more to uncover root causes and formulate a strategy or validate a strategic decision they are taking forward for approval by their executive. **The third set** of users are **Administrators or Super Users** who are behind the console. They work with analysts to ensure that the SiBoNi cockpit and user experience is as per what is required by the leaders and executives.

Depending on the identity access and role the type of view appears once they login. For example an executive will have a different view from that of the analyst or that of admin. Admin or Super User will see the most features and ability to turn off or turn on or set up access et al. The Login page should be simple emulating how [Salesforce.com](https://www.salesforce.com) has its page. A simple login in on the left side, any critical messaging on the right side.

Depending on the industry the cockpit will have nuances and differ. For example an Insurance company CEO may be more focussed on decisions around how the investment of premiums collected is performing while a Automotive CEO is looking at Car sales per week. This is something the SiBoNi core team configures based on their discovery discussions with the customer. For the Product prototype **lets take one industry say Manufacturing** and have prototypes ready. Other two industry specific prototypes could be Healthcare and Financial Services.

For prototype simplicity lets stick to **two user archetypes**. Let's start with a CXO persona first. Let's imagine a CEO. Now as mentioned earlier the CEO should have an interactive interface on the cockpit where a few clicks distills for him the most important information. At the same time he also has the ability to get a snapshot of that information into his EMAIL based on the frequency he configures or asks his team to configure.

We need to think through if we need a mobile app. At this point for ease, we should just have a way for the snapshot to be sent to an **email or messaging app like teams or Slack**. We also need to have a feature for **push notification** coming to Email or maybe even Slack, especially around signals depending on the context of the CEO. For example if they are traveling in a Latin American country, say Brazil, they should get updates on potential supply chain disruption in Brazil or their largest market so that they take corrective action.

Login Page

Emulating how [Salesforce.com](https://www.salesforce.com)

First screen of console

Second screen of console look like when the CEO double clicks on a decision

How the snapshot rendered for an outlook or gmail or slack taking in to consideration they will open it on their ipad or tab or phone could look like

Static Snapshot sent to slack or email, this could be configured based on what CXO wants to see

Key decisions	Top signals
Key KPIs	Top Risks
